"Higher education is in the midst of an extraordinary moment of demographic, economic, and cultural transition that has significant implications for how colleges and universities understand their mission, their market, and their management. This book is aimed at creating a practical understanding of key forces changing higher education, but it goes further. It describes those trends, discusses the real life impact of those trends on campuses, and then lays out concrete steps required to address them. Taking a page from George Keller's classic Academic Strategy, management consultant and college administrator Jon McGee uses these economic and demographic trends to inform his strategic approach to managing schools"--

through the stages of childhood leading up to college, as well as the process of searching for and selecting a college. From the decisions you make during your child's early years to the process of setting up their dorm room, this book provides parents with insights, wisdom, and guidance about college, college preparation, and choosing a college. Letters written by college and educational professionals, all with children, frame and illuminate each chapter. Drawing on their personal and professional experience, these experts offer practical and sympathetic advice about preparing for college. The book concludes with insights about sending children off to college and the appropriate roles for parents as your children experience these important years. Undergirded by research but informed by on-the-ground insight, *Dear Parents* is designed to both engage and inform while demystifying the daunting and ever-changing process of entering college. "Jon McGee is the equivalent of your higher education Sherpa. He has brilliantly succeeded in making the complex and nerve-racking expedition into college search and selection easier to understand. This book is an indispensable resource for students and families embarking on the journey." —Beck A. Taylor, President, Whitworth University

"The economics of American higher education are driven by one key factor--the availability of students willing to pay tuition--and many related factors that determine what schools they attend. By digging into the data, economist Nathan Grawe has created probability models for predicting college attendance. What he sees are alarming events on the horizon that every college and university needs to understand. Overall, he spots demographic patterns that are tilting the US population toward the Hispanic southwest. Moreover, since 2007, fertility rates have fallen by 12 percent. Higher education analysts recognize the destabilizing potential of these trends. However, existing work fails to adjust headcounts for college attendance probabilities and makes no systematic attempt to distinguish demand by institution type. This book analyzes demand forecasts by institution type and rank, disaggregating by demographic groups. Its findings often contradict the dominant narrative: while many schools face painful contractions, demand for elite schools is expected to grow by 15+ percent. Geographic and racial profiles will shift only slightly--and attendance by Asians, not Hispanics, will grow most. Grawe also use the model to consider possible changes in institutional recruitment strategies and government policies. These "what if" analyses show that even aggressive innovation is unlikely to overcome trends toward larger gaps across racial, family income, and parent education groups. Aimed at administrators and trustees with responsibility for decisions ranging from admissions to student support to tenure practices to facilities construction, this book offers data to inform decision-making--decisions that will determine institutional success in meeting demographic challenges"--

What can the human brain and its relationship to the internet tell us about our society, our technologies, and our businesses? A lot, as it turns out. The internet today is a virtual replica of the brain, and the networks that leverage it grow and collapse in ways that are easily predictable if you understand the brain and other biological networks. We're living in the midst of a networking revolution. All of the major technology innovations of the 21st century – social networking, cloud computing, search engines, and crowdsourcing, to name a few – leverage the internet and are thus bound by the rules of networks. We've seen the exponential growth of these technologies, and they've led to a more efficient and tightly connected world. But what many

people don't realize is that all networks eventually reach a breakpoint and collapse. This happens in the brain, it happens in nature, it happened to MySpace, and it will happen to Facebook and Google. It is critical to understand where the breakpoint is in the networks you use in order to achieve optimum success. Navigating the world of new technologies today can be like walking through a minefield unless you know the path. Imagine what you could do with a roadmap for where things are headed? In this fascinating look at the future of business and technology, neuroscientist and entrepreneur Jeff Stibel shows how the brain can act as a guide to understanding the future of the internet and the constellation of businesses and technologies that run on it. He'll show how leaders like Marissa Mayer are using artificial intelligence to literally remake Yahoo! and how startups like oDesk and Kickstarter are using crowdsourcing, the next wave of revolutionary technology, to create something much larger and "smarter" than the sum of their parts. Stibel offers a fresh perspective about the future of business and technology in a candid and engaging manner.

The recent trend of trying to measure higher education's return on investment misses a fundamental point, argue Charity Johansson and Peter Felten. The central purpose of a college or university is to transform the lives of students—not to merely change them or help them mature. This transformation is an ongoing process of intentionally aligning one's behavior with one's core sense of personal identity. It is the university's central role to lead students in this transformation, a process that shapes students into intentional, critical, and engaged individuals. Recognizing the remarkable influence of the college experience on peoples' lives, the authors offer a guide to how colleges and universities can effectively lead students through this life-changing process. Drawn from extensive interviews with students and graduates, faculty and staff, *Transforming Students* gathers diverse stories to show how students experience the transformation process, which rarely follows a neat or linear path. The interviews illustrate central themes from the literature on transformative learning and the undergraduate student experience. A sequel of sorts to George Keller's classic *Transforming a College*—which chronicled Elon University's metamorphosis from struggling college to a top regional university—*Transforming Students* addresses the school's core educational mission: to shape students into engaged adults who embrace learning as a lifelong endeavor. Given this effect, the college experience is much more than preparation for a career. It is preparation for life.

An insightful look at the American environmental crisis and emerging solutions from the heartland to the coasts in the era of global climate change Eminent ecologist Jeremy B. C. Jackson and award-winning journalist Steve Chapple traveled the length of the Mississippi River interviewing farmers, fishermen, scientists, and policymakers to better understand the mounting environmental problems ravaging the United States. Along their journey, which quickly expands to California, Florida, and New York, the pair uncovered surprising and profound connections between ecological systems and environmental crises across the country. Artfully weaving together independent research and engaging storytelling, Jackson and Chapple examine the looming threats from recent hurricanes and fires, industrial agriculture, river mismanagement, extreme weather events, drought, and

rising sea levels that are pushing the country toward the breaking point of ecological and economic collapse. Yet, despite these challenges, the authors provide optimistic and practical solutions for addressing these multidimensional issues to achieve greater environmental stability, human well-being, and future economic prosperity. With a passionate call to action, they look hopefully toward emerging and achievable solutions to preserve the country's future.

Universities for years have been the bright spot in our educational system. Today, these institutions are under siege from multiple constituencies including students, parents, legislators, government officials and their own faculties. Education has historically been a way for students to improve their lives and fortunes. However, the rising costs of college are a barrier to access for many students, reducing their chances for upward mobility. Is technology the solution, or is it just another costly problem for universities? The purpose of this book is to explore how new technology has the potential to transform higher education. However, this same technology also has the potential to disrupt universities. Much depends on how administrators, faculty and students apply technologically enhanced learning. Technology and the Disruption of Higher Education presents details on MOOCs, blended, flipped and online classes and their role in transforming higher education based on the author's experiences teaching all of these types of courses. These technology-enabled approaches to teaching and learning offer tremendous opportunities to schools, but they also threaten the traditional university. The book identifies some of these threats and opportunities and offers suggested strategies to take advantage of the technology. Is this technology enough to save the university system? While new ways of teaching and learning are exciting, they are only part of the puzzle. Radical change beyond what happens in the classroom is needed if our higher education system is to continue to flourish and some of these ideas are discussed in the last chapter of the book. The book is a call to action for educators to realize that the technology is both transformational and disruptive, and that some universities are going to fail in the next 15 years.
