High-dimensional probability offers insight into the behavior of random vectors, random matrices, random subspaces, and objects used to quantify uncertainty in high dimensions. Drawing on ideas from probability, analysis, and geometry, it lends itself to applications in mathematics, statistics, theoretical computer science, signal processing, optimization, and more. It is the first to integrate theory, key tools, and modern applications of high-dimensional probability. Concentration inequalities form the core, and it covers both classical results such as Hoeffding's and Chernoff's inequalities and modern developments such as the matrix Bernstein's inequality. It then introduces the powerful methods based on stochastic processes, including such tools as Slepian's, Sudakov's, and Dudley's inequalities, as well as generic chaining and bounds based on VC dimension. A broad range of illustrations is embedded throughout, including classical and modern results for covariance estimation,

While the computer (hardware) is a physical reality, software is hard to describe. It cannot be touched, tasted, or seen, but it must be built and maintained. It ages, becomes obsolete, and often breaks--but not in the sense that a transistor or a disk drive fails. It is this realization that separates the current view of software from that of 30 years ago. What is software? The "Computer" articles reprinted in this volume explore some of the answers to that question. The articles selected address four topics: programming languages, software
