Associationism and the Literary Imagination traces the influence of empirical philosophy and associationist psychology on theories of literary creativity and on the experience of reading literature. It runs from David Hume's Treatise of Human Nature in 1739 to the works of major literary critics of the twentieth century, such as I.A. Richards, W.K. Wimsatt and Northrop Frye. Cairns Craig explores the ways in which associationist conceptions of literature gave rise to some of the key transformations in British writing between the romantic and modernist periods. In particular, he analyses the ways in which authors' conceptions of the form of their readers' aesthetic experience led to radical developments in literary style, from the fragmentary narrative of Sterne's Tristram Shandy in 1760 to Virginia Woolf's experiments in the rendering of characters' consciousness in the 1920s; and from Wordsworth's poetic use of autobiography to J.G. Frazer's exploration of a mythic unconscious in The Golden Bough. Detailed analyses are offered of the ways in which a wide variety of major British writers, including Scott, Lady Morgan, Dickens, Tennyson, Hardy, Yeats, Joyce and Woolf developed their literary techniques on the basis of associationist conceptions of the mind, and of how modern literary criticism - from Arthur Symons to Roland Barthes - is founded on associationist principles. Associationism and the Literary Imagination relocates the traditions of British writing since the eighteenth century within the neglected context of its native empirical philosophy, and reveals how many of the issues assumed to be products of 'postmodern' or 'deconstructive' theory have long been foregrounded and debated within the traditions of British empiricism. This is a work which provides a radical new perspective on the history of literature in Britain and Ireland and challenges many of the assumptions of contemporary theoretical debate about the

In chassis development, the three aspects of safety, vehicle dynamics and ride comfort are at the top of the list of challenges to be faced. Addressing this triad of challenges becomes even more complex when the chassis is required to interact with assistance systems and other systems for fully automated driving. What is more, new demands are created by the introduction of modern electric and electronic architectures. All these requirements must be met by the chassis, together with its subsystems, the steering, brakes, tires and wheels. At the same time, all physical relationships and interactions have to be taken into account.

Antistatic sprays from several different manufacturers are examined. The sprays are examined for contamination potential (i.e., outgassing and nonvolatile residue), corrosiveness on an aluminum mirror surface, and electrostatic effectiveness. In addition, the chemical composition of the antistatic sprays is determined by infrared spectrophotometry, mass spectrometry, and ultraviolet spectrophotometry. The results show that 12 of the 17 antistatic sprays examined have a low contamination potential. Of these sprays, 7 are also noncorrosive to an aluminum surface. And of these, only 2 demonstrate good electrostatic properties with respect to reducing voltage accumulation; these sprays did not show a fast voltage dissipation rate however. The results indicate that antistatic sprays can be used on a limited basis where contamination potential, corrosiveness, and electrostatic effectiveness is not critical. Each application is different and proper evaluation of the situation is necessary. Information on some of the properties of some antistatic sprays is presented in this document to aid in the evaluation process. Ming, James E. Goddard Space Flight Center
