Monitoring for fruit fly trappings & larvae in fruit. Monitoring traps. Purchase a suitable fruit fly trap from a nursery or agricultural supplier. Hang traps in fruit trees about 1.5m high. Monitor weekly for fruit fly trappings in spring, summer & autumn; fortnightly in winter.

Queensland Fruit Fly - Riverina Local Land Services

4 Fruit Fly Management for Vegetable Growers QUEENSLAND FRUIT FLY (*Bactrocera tryoni*) Queensland fruit fly or Qfly is the species most people think

about when discussing fruit fly control. Qfly can infest nearly all fruit and fruiting vegetables, including Solanaceae (capsicums, chillies) and cucurbits (zucchini, cucumber).

Fruit Fly Management for Vegetable Growers

The Rotary Club of Benalla is reminding local gardeners that it is time to help prevent the spread of Queensland Fruit Fly. Club member Bruce Walker said now that it was late spring there were a number of important tasks home gardeners should be undertaking to manage the invasive pest.

Throughout Asia, Australia and the Pacific, and increasingly in Africa, the primary horticultural insect pests are fruit flies belonging to the genera *Bactrocera*, *Zeugodacus* and *Dacus* (Diptera: Tephritidae: Dacini). The Dacini is a hugely diverse clade of nearly 900 species endemic to the rainforests of Asia, Australia and the western Pacific, and the savannas and woodlands of Africa. All these species lay their eggs into fleshy fruits and vegetables, where the maggots feed, therefore destroying the fruit. In addition to being crop pests, dacines are also invasive pests of major quarantine importance and their presence in production areas can significantly impact market access opportunities. This broad text provides a rapid introduction to this economically and ecologically important group, which includes species such as the Oriental fruit fly (*B. dorsalis*), Melon fly (*Z. cucurbitae*), Queensland fruit fly (*B. tryoni*) and the Olive fly (*B. oleae*). Broken into three primary sections, it first explores the evolutionary history, systematic relationships, taxonomy and species-level diagnosis of the Dacini flies. The following biology section covers their life history, population demography, behaviour and ecology, and natural enemies. The final section of the book covers the management of these flies, with chapters on pre-harvest, post-harvest and regulatory controls. Each chapter concludes with a list of key monographs, papers or book chapters for further reading. This book will be of interest to field entomologists, extension officers, quarantine officers and market access negotiators, as well as students of applied entomology and pest management.

The first of two volumes, this book covers major tropical fruits such as avocado, litchi, mango, papaya and pineapple. Early chapters describe the tropics and its soils and deal with key issues such as tree management and postharvest handling, updated and expanded to include best handling practices and food safety issues and the way to address these issues in marketing. Following these are self-contained chapters on single fruits which provide in-depth studies of botany, areas of origin and distribution, descriptions of ecological requirements and world production and utilization of each fruit.
