It can be surprising which objects float and which don't. An apple floats, but a ball of aluminum foil does not. If that same ball of foil is shaped into a boat, it floats! Why? And how is it possible that a huge ship made of steel can float? Answering these questions about density and flotation is David A. Adler's clear, concise text, paired with Anna Raff's delightful illustrations. Activities that demonstrate the properties of flotation are included.

Since its beginning, when its predecessor, the Bank of Toronto, was founded by a group of flour millers and grain dealers, TD Bank has evolved into one of the most proactive financial institutions on the planet. Today, it is a cross-border colossus. The bank's expansion into the United States could yet prove to be one of its most successful ventures, with the familiar TD logo and its green background lighting up buildings in Manhattan and other major American cities. The bank is also the largest shareholder of TD Ameritrade, a company that does more daily trades than any other online brokerage in the world, and the bank itself now has over 1,300 branches in the States; more than it has in Canada; even as other institutions continue to close in the face of the financial crisis. Howard Green, Canada's best-known interviewer of business notables, brings this Canadian bank to life through the people who have built it into a money-spinning machine that now generates some \$19 million a day in profit. From the times of former executive Keith Gray, who kept a revolver on his desk in the rural Ontario branches of the 1950s, to today's CEO, Ed Clark, who oversees 85,000 employees, 22 million customers and more than three-quarters of a trillion dollars in assets, this iconic Canadian company has outshone its American counterparts and is now taking over their world.

The Elements has become an international sensation, with over one million copies in-print worldwide. The highly-anticipated paperback edition of The Elements is finally available. An eye-opening, original collection of gorgeous, never-before-seen photographic representations of the 118 elements in the periodic table. The elements are what we, and everything around us, are made of. But how many elements has anyone actually seen in pure, uncombined form? The Elements provides this rare opportunity. Based on seven years of research and photography, the pictures in this book make up the most complete, and visually arresting, representation available to the naked eye of every atom in the universe. Organized in order of appearance on the periodic table, each element is represented by a spread that includes a stunning, full-page, full-color photograph that most closely represents it in its purest form. For example, at -183°C, oxygen turns from a colorless gas to a beautiful pale blue liquid. Also included are fascinating facts, figures, and stories of the elements as well as data on the properties of each, including atomic weight, density, melting and boiling point, valence, electronegativity, and the year and location in which it was discovered. Several additional photographs show each element in slightly altered forms or as used in various practical ways. The element's position on the periodic table is pinpointed on a mini rendering of the table and an illustrated scale of the element's boiling and/or melting points appears on each page along with a density scale that runs along the bottom. Packed with interesting information, this combination of solid science and stunning artistic photographs is the perfect gift book for every sentient creature in the universe. Includes a tear-out poster of Theodore Gray's iconic Photographic Periodic Table!

Includes the periodic table, writing formulas, balancing equations, stoichiometry problems, and more.
