For many years, the study of cremated bone has been seen as less important and worthwhile than the study of unburned human remains. Williams (2008), in the excellent Schmidt and Symes edited volume *The Analysis of Burned Human Remains*, has argued that human remains from cremation contexts were viewed as being peripheral to other less fragmented bodies, such as unburned remains, mummies and bog bodies.

Equally, the archaeology of cremation is much broader than the analysis of burned bones. The landscapes, spaces, monuments, contexts, artefacts and bones associated with cremation practices need to be integrated into theorized interpretations of social structure, symbolism, power, personhood and social memory.

In archaeology, color is a fossil indicator of human behaviour, but for more recent times we can attempt to achieve a greater understanding. Color and appearance are essential to the well-being of many living organisms, essential to the lowliest of insects, to plants, to animals and to mankind.

**Human societies have disposed of their dead in a variety of ways. However, while considerable attention has been paid to bodies that were buried, comparatively little work has been devoted to understanding the nature of cremated remains, despite their visibility through time. It has been argued that this is the result of decades of misunderstanding regarding the potential information that this material holds, combined with properties that make burned bone inherently difficult to analyse. As such, there is a considerable body of knowledge on the concepts and practices of inhumation yet our understanding of cremation ritual and practice is by comparison, woefully inadequate. This timely volume therefore draws together the inventive methodology that has been developed for this material and combines it with a fuller interpretation of the archaeological funerary context. It demonstrates how an innovative methodology, when applied to a challenging material, can produce new and exciting interpretations of archaeological sites and funerary contexts. The reader is introduced to the nature of burned human remains and the destructive effect that fire can have on the body. Subsequent chapters describe important cremation practices and sites from around the world and from the Neolithic period to the modern day. By emphasising the need for a robust methodology combined with a nuanced interpretation, it is possible to begin to appreciate the significance and wide-spread adoption of this practice of dealing with the dead.**

This unique reference provides a primary source for osteologists and the medical/legal community for the understanding of burned bone remains in forensic or archaeological contexts. It describes in detail the changes in human bone and soft tissues as a body burns at both the chemical and gross levels and provides an overview of the current procedures in burned bone study. Case studies in forensic and archaeological settings aid those interested in the analysis of burned human bodies, from death scene investigators, to biological anthropologists looking at the recent or ancient dead. Includes the diagnostic patterning of color changes that give insight to the severity of burning, the positioning of the body, and presence (or absence) of soft tissues during the burning event Chapters on bones and teeth give step-by-step recommendations for how to study and recognize burned hard tissues

*Transformation by Fire* offers a current assessment of the archaeological research on the widespread social practice of cremation. Editors Ian Kuijt, Colin P. Quinn, and Gabriel Cooney chart a path for the development of interpretive archaeology surrounding this complex social process.

This collection brings together leading experts and new voices in the study of death in the human past. The book explores the rich range of archaeological evidence shedding light on the use of cremation from prehistory to the present day.

The *Archaeology of Human Bones* provides an up to date account of the analysis of human skeletal remains from archaeological sites, introducing students to the anatomy of bones and teeth and the nature of the burial record. Drawing from studies around the world, this book illustrates how the scientific study of human remains can shed light upon important archaeological and historical questions. This new edition reflects the latest developments in scientific techniques and their application to burial archaeology. Current scientific methods are explained, alongside a critical consideration of their strengths and weaknesses. The book has also been thoroughly revised to reflect changes in the ways in which scientific studies of human remains have influenced our understanding of the past, and has been updated to reflect developments in ethical debates that surround the treatment of human remains. There is now a separate chapter devoted to archaeological fieldwork on burial grounds, and the chapters on DNA and ethics have been completely rewritten. This edition of *The Archaeology of Human Bones* provides not only a more up to date but also a more comprehensive overview of this crucial area of archaeology. Written in a clear style with technical jargon kept to a minimum, it continues to be a key work for archaeology students.

The fiery transformation of the dead is replete in our popular culture and Western modernity's death ways, and yet it is increasingly evident how little this disposal method is understood by archaeologists and students of cognate disciplines in the humanities and social sciences. In this regard, the archaeological study of cremation has much to offer. Cremation is a fascinating and widespread theme and entry-point in the exploration of the variability of mortuary practices among past societies. Seeking to challenge simplistic narratives of cremation in the past and present, the studies in this volume seek to confront and explore the challenges of interpreting the variability of cremation by contending with complex networks of modern allusions and imaginings of cremations past and present and ongoing debates regarding how we identify and interpret cremation in the archaeological record. Using a series of original case studies, the book investigates the archaeological traces of cremation in a varied selection of prehistoric and historic contexts from the Mesolithic to the present in order to explore cremation from a practice-oriented and historically situated perspective.
